

BIOSYNTHETIC PATHWAY TRANSCRIPTION FACTORS

ABSTRACT OF THE DISCLOSURE

5 The present invention provides a high-throughput method for identifying a polynucleotide which encodes a transcription factor for controlling the expression of one or more genes in a pathway. In particular, the method is useful for identifying a transcription factor for controlling a gene in a biosynthetic pathway. The invention further provides polynucleotides encoding such transcription factors for controlling the expression of a gene in a biosynthetic pathway, transgenic cells expressing at least one such polynucleotide, and methods for isolating metabolites
10 from such cells or plants.
